Project Design Phase

Incident Life Cycle Automation in ServiceNow

Student Name	Mudadla Mohan
Project	Incident Life Cycle Automation in ServiceNow
Phase Focus	Design the ServiceNow workflow, data relationships and operational flow needed to support the complete incident lifecycle.

Project Overview

This document presents the selected project phase in a structured and professional format. The content is prepared from the project evidence supplied in the SkillWallet scan, with the original project screenshots arranged as visual evidence.

Phase Objective

Design the ServiceNow workflow, data relationships and operational flow needed to support the complete incident lifecycle.

System Design

The project is designed around the ServiceNow Incident Management process and its related records. The supplied evidence shows services, service offerings and configuration items being connected with incident records.

- Service → Service Offering → Configuration Item relationships support service context.
- Incident records capture issue details, impact, urgency, assignment and related information.
- Knowledge is connected to incident troubleshooting.
- Change requests are linked when an incident requires a controlled change.
- Child incidents are linked to a parent incident for related issues.

Incident Lifecycle Flow

The designed flow moves from incident creation to classification, investigation, reassignment or escalation, change handling when necessary, resolution, knowledge creation and final validation.

- Create the incident record.
- Classify and assign the incident.
- Use knowledge assistance during investigation.
- Reassign/escalate to Level 2 when needed.
- Create a change request for emergency change scenarios.
- Create child incidents for related issues.
- Add cause and resolution details.
- Validate related records, SLA tracking and knowledge.

Design Considerations

The project evidence emphasizes traceability and integration between Incident, Change and Knowledge activities. The design therefore keeps important lifecycle information visible through related records and activity history.

- Maintain clear ownership through assignment groups and reassignment.
- Keep incident activity and work notes available for collaboration.
- Use knowledge articles to reduce repeated troubleshooting effort.
- Preserve parent-child relationships for recurring issues.
- Use validation checkpoints before considering the lifecycle complete.

Project Evidence / Screenshots

The following screenshots are taken from the supplied 35-page project scan and are placed neatly as evidence for this phase.

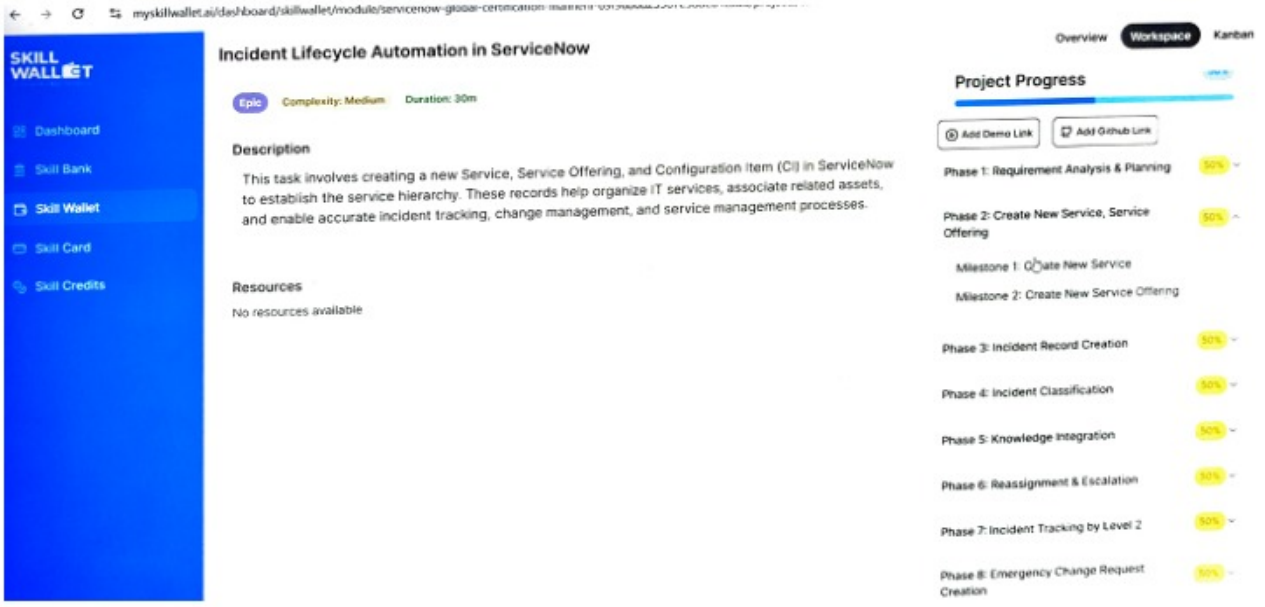

Figure 6: Service and service offering configuration task in the supplied project.

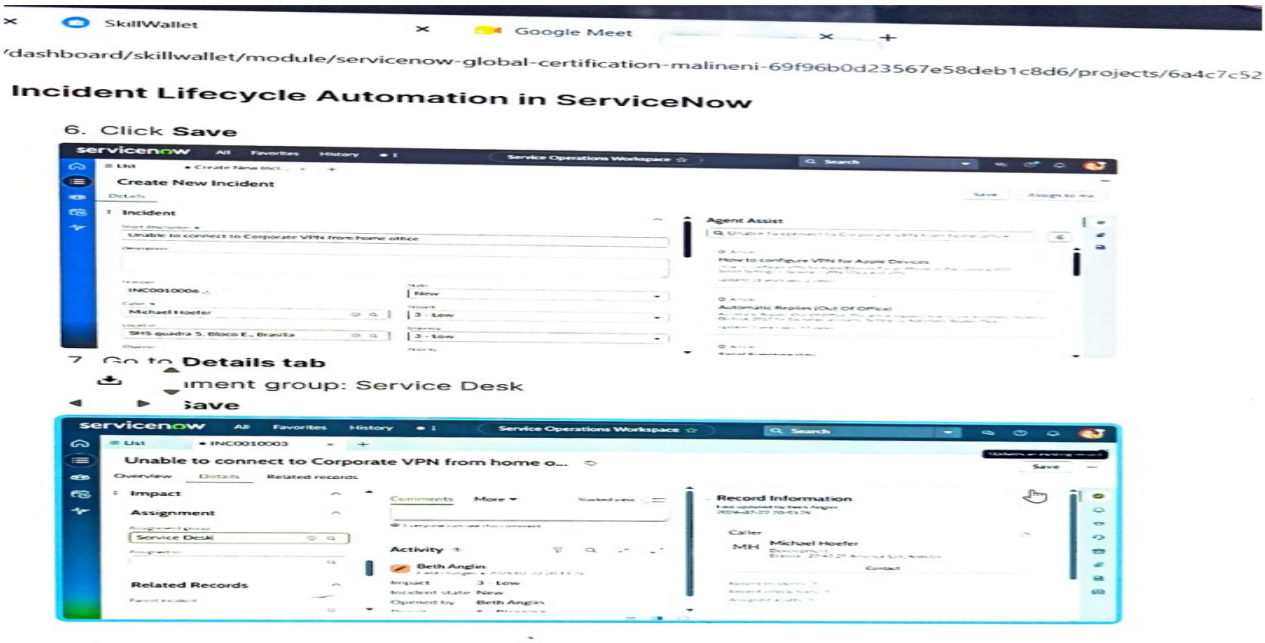

Figure 8: Incident screen showing details and Agent Assist knowledge suggestions.

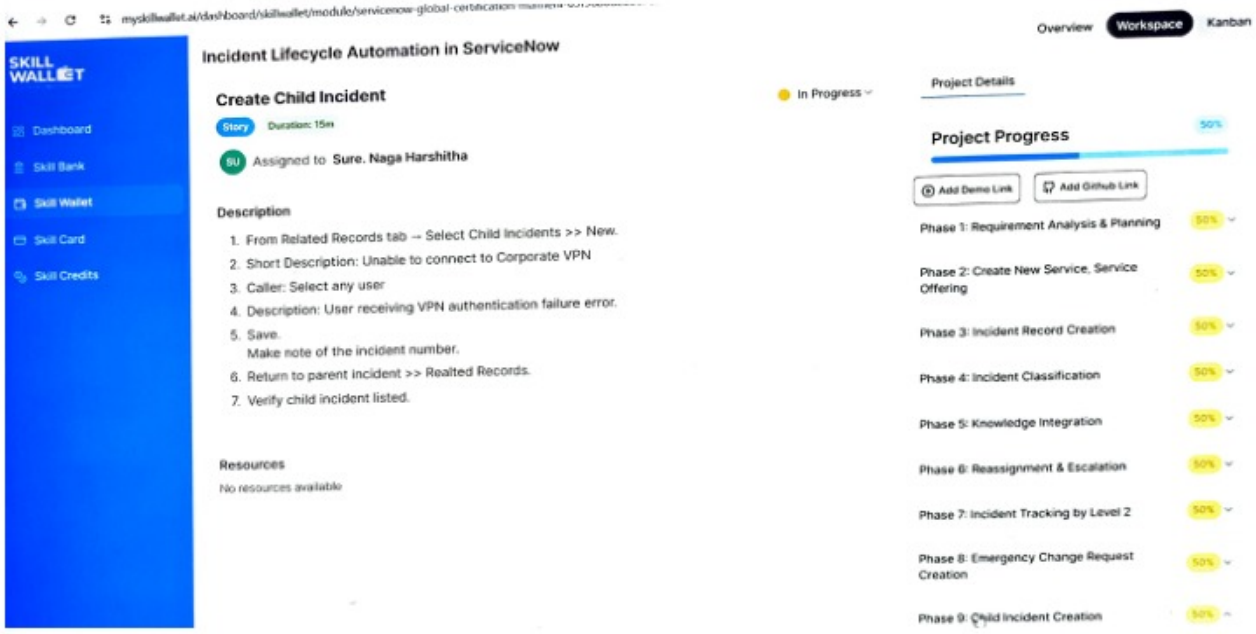

Figure 24: Child incident creation and parent-child relationship flow.
