Project Development Phase

Incident Life Cycle Automation in ServiceNow

Student Name	Mudadla Mohan
Project	Incident Life Cycle Automation in ServiceNow
Phase Focus	Implement the planned ServiceNow configuration and execute the incident lifecycle tasks described in the project.

Project Overview

This document presents the selected project phase in a structured and professional format. The content is prepared from the project evidence supplied in the SkillWallet scan, with the original project screenshots arranged as visual evidence.

Phase Objective

Implement the planned ServiceNow configuration and execute the incident lifecycle tasks described in the project.

Service and Incident Configuration

Development starts with creating the required Service and Service Offering. The supplied evidence then moves to incident record creation and updating incident details.

- Create the service record and set its operational details.
- Create the service offering and associate it with the service.
- Create incident records in Service Operations Workspace.
- Populate caller, short description, service, assignment and impact/urgency details.

Lifecycle Features Implemented

The project evidence documents the development of classification, knowledge integration, reassignment, Level 2 investigation, emergency change, child incident creation and resolution.

- Classify incidents using category, subcategory and urgency.
- Use Agent Assist to find relevant knowledge articles.
- Reassign incidents to the Network/appropriate support group.
- Update the watch list and work-note collaborators.
- Investigate incidents through Level 2 support.
- Create emergency changes when infrastructure changes are required.
- Create child incidents for related issues.
- Add cause and resolution information and resolve the incident.

Development Result

The developed workflow connects the major incident-management activities so that an issue can be tracked from creation through resolution and validation. The project evidence also shows knowledge creation and testing/deployment validation as later implementation activities.

- Maintain traceability through related records.
- Use structured fields for consistent incident handling.
- Keep resolution information documented.
- Validate the completed workflow before deployment.

Project Evidence / Screenshots

The following screenshots are taken from the supplied 35-page project scan and are placed neatly as evidence for this phase.
